LIGHT CLOUDS

The proposed design for the lighthouse combines the traditional functions of a lighthouse with that of a transformative complex lighting structure. "Fireworks" at the base and a saucered mountain range that mirror across the sky’s reflection. A circular array of stars that rise from the base and the top of the tower is used for tracking small and reflecting down. At night, the lights inside the tower are reflected onto the river. The site transitions into key parts of colorful and dynamic clouds, drawing and capturing the beauty that is empowering others.
