LIGHT OF LIFE AND DEATH

Lighthouse is a remarkable object between land and sea sky and ground light and darkness. In our design, the new lighthouse acts as a spiritual vessel between life and death. In this site where Costa Concordia cruise ship partially sank resulting in the loss of 32 lives, we take advantage of a symmetrical shape of light to guide both in life world and in death world. A ring platform which bear the main function space float on the water surface from where we could see the remaining hint of the disaster which is lighted up at seabed, and rethink about meaning of life. To bring us closer to the event of sinking, an slight slope is designed around the empty center, allowing the sea water submerging the platform surface partially and creating a special experience. Also, all this system is supported by wave energy generation in an eco-friendly way.
