Freelight is a new view of lighthouse system. It gives us a possibility to rethink the functional part and keep the traditional symbol of lighthouse. Hovering light represents the idea of freedom and, which willing to guide, and help. The lighthouse object divided into two main separate parts: aerostat with light lamp and stationary construction. They interact by cables system and controlling mechanism. Ground part is a two level reinforced concrete structure, organically inscribed in the coastal relief. Level A provides a living area for lighthouse keeper and mechanical room for navigational equipment and aerostat control system. Upper level B is designed as observation deck, place for those who want to escape from urban environment and merge with space and feel the power of the nature. It organized to host one or two persons a time and have open terrace which presents spectacular view of sea space.
